Logic Systems

Lattices, classical logic and quantum logic

Logic – Lattice structure

- A lattice is a set of elements a, b, c, ...that is closed for the connections \cap and \cup . These connections obey:
 - The set is partially ordered. With each pair of elements a, b belongs an element c, such that $a \subset c$ and $b \subset c$.
 - The set is a \cap half lattice if with each pair of elements a, b an element c exists, such that $c = a \cap b$.
 - The set is a \cup half lattice if with each pair of elements a, b an element c exists, such that $c = a \cup b$.
 - The set is a lattice if it is both a ∩ half lattice and a U half lattice.

Partially ordered set

• The following relations hold in a lattice:

$$a \cap b = b \cap a$$

 $(a \cap b) \cap c$
 $= a \cap (b \cap c)$
 $a \cap (a \cup b) = a$
 $a \cup b = b \cup a$
 $(a \cup b) \cup c$
 $= a \cup (b \cup c)$
 $a \cup (a \cap b) = a$

- has a partial order inclusion ⊂:
 a ⊂ b ⇔ a ⊂ b = a
- A complementary lattice contains two elements n and e with each element a an complementary element a'

$$a \cap a' = n$$
 $a \cap n = n$
 $a \cap e = a$ $a \cup a' = e$
 $a \cup e = e$ $a \cup n = a$

Orthocomplemented lattice

• Contains with each element a an element a" such that:

$$a \cup a'' = e$$
 $a \cap a'' = n$
 $(a'')'' = a$
 $a \subset b \iff b'' \subset a''$

Distributive lattice

$$a \cap (b \cup c)$$

$$= (a \cap b) \cup (a \cap c)$$

$$a \cup (b \cap c)$$

$$= (a \cup b) \cap (a \cup c)$$

Modular lattice

$$(a \cap b) \cup (a \cap c) = a \cap (b \cup (a \cap c))$$

Classical logic is an orthocomplemented modular lattice

Weak modular lattice

• There exists an element *d* such that

$$a \subset c \Leftrightarrow (a \cup b) \cap c$$

= $a \cup (b \cap c) \cup (d \cap c)$

• where *d* obeys:

$$(a \cup b) \cap d = d$$

 $a \cap d = n$ $b \cap d = n$
 $[(a \subset g) \text{ and } (b \subset g) \Leftrightarrow d \subset g]$

Atoms

In an atomic lattice

$$\exists_{p \in L} \forall_{x \in L} \{x \subset p \Rightarrow x = n\}$$

$$\forall_{a \in L} \forall_{x \in L} \{ (a < x < a \cap p) \\ \Rightarrow (x = a \text{ or } x = a \cap p) \}$$

p is an atom

Logics

- Classical logic has the structure of an orthocomplemented distributive modular and atomic lattice.
- Quantum logic has the structure of an orthocomplented weakly modular and atomic lattice.
- Also called orthomodular lattice.

Hilbert space

- The set of closed subspaces of an infinite dimensional separable
 Hilbert space forms an orthomodular lattice
- •Is lattice isomorphic to quantum logic

Back

Hilbert logic

- Add linear propositions
 - Linear combinations of atomic propositions
- Add relational coupling measure
 - Equivalent to inner product of Hilbert space
- Close subsets with respect to realational coupling measure

- Propositions ⇔ subspaces

Superposition principle

Linear combinations of linear propositions are again linear propositions that belong to the same Hilbert logic system

Isomorphism

- Lattice isomorhic
 - Propositions ⇔ closed subspaces

- Topological isomorphic
