

Just a dream based on hypothetical science based on previous paper we wrote before

In this paper we will talk about a new experiment that hopefully would turn into an invention

Bring a battery of high voltage and heat a spaceship in all portions and then put the spaceship inside a silver plated from the inside hollow ball that is inside another silver plated hollow ball inside another and so on and heat the balls as well and make this set up in free space add pressure on the balls from the outside of each ball so that the space ship would move due to what is mentioned in the paper "bomb energy accumulation to masses and movement" also you can transform masses into energy inside other balls and heat up everything without a battery as mentioned in the previous paper as well and then after the spaceship moves inside of the hollow balls and as you move the hollow balls as well you can move through space with more ease due to what we talked about in the paper "relativity explained"
