## Abstract

The writing intends to bring out certain inconsistent aspects relating to the Taylor expansion. The Taylor series does not hold for the entire real axis that leads to a host of problems.

## Introduction

The Taylor series is well known for its application in mathematics and in physics. The article brings out some anomalous features about the Taylor expansion

## Various Inconsistencies

## Case 1.

We consider

$$
\begin{equation*}
f(x+2 h)=f((x+h)+h) \tag{1}
\end{equation*}
$$

Expanding about $(x+h)$

$$
\begin{equation*}
f(x+2 h)=f(x+h)+\frac{h}{1!} f^{\prime}(x+h)+\frac{h^{2}}{2!} f^{\prime \prime}(x+h)+\frac{h^{3}}{3!} f^{\prime \prime \prime}(x+h)+\cdots \ldots \tag{2}
\end{equation*}
$$

Expanding about $x=x$

$$
\begin{equation*}
f(x+2 h)=f(x)+\frac{2 h}{1!} f^{\prime}(x+h)+\frac{4 h^{2}}{2!} f^{\prime \prime}(x+h)+\frac{8 h^{3}}{3!} f^{\prime \prime \prime}(x+h)+\cdots \ldots \tag{3}
\end{equation*}
$$

From (2) and (3)

$$
\begin{aligned}
& f(x+h)+\frac{h}{1!} f^{\prime}(x+h)+\frac{h^{2}}{2!} f^{\prime \prime}(x+h)+\frac{h^{3}}{3!} f^{\prime \prime \prime}(x+h)+\cdots \ldots \\
&=f(x)+\frac{2 h}{1!} f^{\prime}(x)+\frac{4 h^{2}}{2!} f^{\prime \prime}(x)+\frac{8 h^{3}}{3!} f^{\prime \prime \prime}(x)+\cdots \ldots
\end{aligned}
$$

$$
\begin{gather*}
f(x+h)-f(x)+h\left[f^{\prime}(x+h)-2 f^{\prime}(x)\right]+\frac{1}{2!} h^{2}\left[f^{\prime \prime}(x+h)-4 f^{\prime \prime}(x)\right] \\
+\frac{1}{3!} h^{3}\left[f^{\prime \prime \prime}(x+h)-8 f^{\prime \prime \prime}(x)\right]+\cdots . .=0(4)  \tag{4}\\
\frac{f(x+h)-f(x)}{h} \frac{1}{h}+\frac{\left[f^{\prime}(x+h)-2 f^{\prime}(x)\right]}{h}+\frac{1}{2!}\left[f^{\prime \prime}(x+h)-4 f^{\prime \prime}(x)\right]+\frac{1}{3!} h\left[f^{\prime \prime \prime}(x+h)-8 f^{\prime \prime \prime}(x)\right] \\
+\cdots . .=0
\end{gathered} \begin{gathered}
\frac{f(x+h)-f(x)}{h} \frac{1}{h}+\frac{\left[f^{\prime}(x+h)-f^{\prime}(x)\right]}{h}-\frac{f^{\prime}(x)}{h}+\frac{1}{2!}\left[f^{\prime \prime}(x+h)-4 f^{\prime \prime}(x)\right] \\
+\frac{1}{3!} h\left[f^{\prime \prime \prime}(x+h)-8 f^{\prime \prime \prime}(x)\right]+h[\ldots . .]=0(5)
\end{gather*}
$$

Equation (5) is considered for $h \neq 0$. Even when we go for $h \rightarrow 0, h$ does not become equal to zero. It is in the neighborhood of zero without becoming equal to zero]

$$
\begin{gathered}
{\left[\begin{array}{c}
\left.\frac{f(x+h)-f(x)}{h}-f^{\prime}(x)\right] \frac{1}{h}+\frac{\left[f^{\prime}(x+h)-f^{\prime}(x)\right]}{h}+\frac{1}{2!}\left[f^{\prime \prime}(x+h)-4 f^{\prime \prime}(x)\right] \\
+\frac{1}{3!} h\left[f^{\prime \prime \prime}(x+h)-8 f^{\prime \prime \prime}(x)\right]+h[\ldots . .]=0
\end{array}\right.} \\
\operatorname{Lim}_{h \rightarrow 0}\left[\frac{f(x+h)-f(x)}{h}-f^{\prime}(x)\right] \frac{1}{h}+\operatorname{Lim}_{h \rightarrow 0} \frac{\left[f^{\prime}(x+h)-f^{\prime}(x)\right]}{h} \\
+\frac{1}{2!} \operatorname{Lim}_{h \rightarrow 0}\left[f^{\prime \prime}(x+h)-4 f^{\prime \prime}(x)\right]+\frac{1}{3!} \operatorname{Lim}_{h \rightarrow 0} h\left[f^{\prime \prime \prime}(x+h)-8 f^{\prime \prime \prime}(x)\right]+h[\ldots . .] \\
=0(6)
\end{gathered}
$$

We are considering a function for which

$$
\operatorname{Lim}_{h \rightarrow 0} h\left[f^{\prime \prime \prime}(x+h)-8 f^{\prime \prime \prime}(x)\right]+h[\ldots . .]=0
$$

Then

$$
\begin{gathered}
\operatorname{Lim}_{h \rightarrow 0}\left[\frac{f(x+h)-f(x)}{h}-f^{\prime}(x)\right] \frac{1}{h}+f^{\prime \prime}(x)-\frac{3}{2} f^{\prime \prime}(x)=0 \\
\operatorname{Lim}_{h \rightarrow 0}\left[\frac{f(x+h)-f(x)}{h}-f^{\prime}(x)\right] \frac{1}{h}=\frac{1}{2} f^{\prime \prime}(x) \\
\operatorname{Lim}_{h \rightarrow 0} \frac{\left[\frac{f(x+h)-f(x)}{h}-f^{\prime}(x)\right]}{h}=\frac{1}{2} f^{\prime \prime}(x) \text { (7) }
\end{gathered}
$$

We apply L' Hospital's rule ${ }^{[1]}$ to obtain

$$
\operatorname{Lim}_{h \rightarrow 0} \frac{\frac{d}{d h}\left[\frac{f(x+h)-f(x)}{h}-f^{\prime}(x)\right]}{1}=\frac{1}{2} f^{\prime \prime}(x)
$$

$$
\begin{gather*}
\operatorname{Lim}_{h \rightarrow 0} \frac{\frac{d}{d h}\left[\frac{f(x+h)-f(x)}{h}-f^{\prime}(x)\right]}{1}=\frac{1}{2} f^{\prime \prime}(x) \\
\operatorname{Lim}_{h \rightarrow 0}\left[-\frac{1}{h^{2}}(f(x+h)-f(x))+\frac{1}{h}\left(f^{\prime}(x+h)-f^{\prime}(x)\right)\right]=\frac{1}{2} f^{\prime \prime}(x) \\
{\left[-\operatorname{Lim}_{h \rightarrow 0} \frac{1}{h^{2}}(f(x+h)-f(x))+\operatorname{Lim}_{h \rightarrow 0} \frac{1}{h}\left(f^{\prime}(x+h)-f^{\prime}(x)\right)\right]=\frac{1}{2} f^{\prime \prime}(x)( }  \tag{8}\\
-\infty+f^{\prime \prime}(x)=\frac{1}{2} f^{\prime \prime}(x) \\
-\frac{1}{2} f^{\prime \prime}(x)=-\infty
\end{gather*}
$$

As claimed we have brought out an aspect of inconsistency with Taylor Series.
Case 2.Let us have another situation for our analysis. We write the Taylor series

$$
\begin{equation*}
f\left(x_{0}+h\right)=f\left(x_{0}\right)+\frac{h}{1!} f^{\prime}\left(x_{0}\right)+\frac{h^{2}}{2!} f^{\prime \prime}\left(x_{0}\right)+\frac{h^{3}}{3!} f^{\prime \prime \prime}\left(x_{0}\right)+\cdots \ldots \tag{9}
\end{equation*}
$$

The increment $h$ may be sufficiently large subject to the fact that the series has to converge.

$$
\begin{gather*}
\frac{\partial f\left(x_{0}+h\right)}{\partial h}=f^{\prime}\left(x_{0}\right)+h f^{\prime \prime}\left(x_{0}\right)+\frac{h^{2}}{2!} f^{\prime \prime \prime}\left(x_{0}\right)+\cdots(10) \\
\lim _{h \rightarrow 0} \frac{\partial f\left(x_{0}+h\right)}{\partial h}=f^{\prime}\left(x_{0}\right)(11)  \tag{11}\\
\lim _{h \rightarrow 0} F_{h}\left(x_{0}+h\right)=f^{\prime}\left(x_{0}\right)
\end{gather*}
$$

The limit $f^{\prime}\left(x_{0}\right)$ is independent of $h$. This is an example of uniform convergence. We may analyze as follows:

$$
\frac{\partial f(x)}{\partial h}=\frac{\partial f\left(x_{0}+h\right)}{\partial h}
$$

is evaluated for different values of $h:\left[\frac{\partial f(x)}{\partial h}\right]_{h_{1}},\left[\frac{\partial f(x)}{\partial h}\right]_{h_{2}},\left[\frac{\partial f(x)}{\partial h}\right]_{h_{3}} \ldots$ The limit $f^{\prime}\left(x_{0}\right)$ is independent of $x$

Therefore we can interchange the derivative and the limit ${ }^{[2]}$.

$$
\begin{gathered}
\frac{\partial}{\partial h} \lim _{h \rightarrow 0} \frac{\partial f\left(x_{0}+h\right)}{\partial h}=0 \\
\lim _{h \rightarrow 0} \frac{\partial}{\partial h}\left[\frac{\partial f\left(x_{0}+h\right)}{\partial h}\right]=0(12) \\
\lim _{h \rightarrow 0} \frac{\partial}{\partial h}\left[\frac{\partial f\left(x_{0}+h\right)}{\partial h}\right]=0 \\
\lim _{h \rightarrow 0} \frac{\partial^{2} f\left(x_{0}+h\right)}{\partial h^{2}}=0 \\
\lim _{h \rightarrow 0} \frac{\partial}{\partial h}\left[\frac{\partial f\left(x_{0}+h\right)}{\partial h}\right]=0 \\
\lim _{h \rightarrow 0} \frac{\partial}{\partial h}\left[\frac{\partial f\left(x_{0}+h\right)}{\partial\left(x_{0}+h\right)} \frac{\partial\left(x_{0}+h\right)}{\partial h}\right]=0 \\
\lim _{h \rightarrow 0} \frac{\partial}{\partial h}\left[\frac{\partial f\left(x_{0}+h\right)}{\partial\left(x_{0}+h\right)}\right]=0 \\
\lim _{h \rightarrow 0} \frac{\partial}{\partial\left(x_{0}+h\right)}\left[\frac{\partial f\left(x_{0}+h\right)}{\partial\left(x_{0}+h\right)}\right] \frac{\partial\left(x_{0}+h\right)}{\partial h}=0 \\
\lim _{h \rightarrow 0} \frac{\partial}{\partial x}\left[\frac{\partial f(x)}{\partial x}\right]=0
\end{gathered}
$$

where $x=x_{0}+h$
We now have,

$$
\begin{align*}
\lim _{h \rightarrow 0} \frac{\partial^{2} f(x)}{\partial x^{2}} & =0  \tag{13}\\
{\left[\frac{\partial^{2} f(x)}{\partial x^{2}}\right]_{x=x_{0}} } & =0
\end{align*}
$$

But $x=x_{0}$ could be any arbitrary point.
By differentiating (10) we obtain the expected result

$$
\begin{equation*}
\frac{\partial^{2} f\left(x_{0}+h\right)}{\partial h^{2}}=f^{\prime \prime}\left(x_{0}\right)( \tag{14}
\end{equation*}
$$

which contradicts the earlier result given by (13)unless $f^{\prime \prime}\left(x_{0}\right)=0$

## Direct Calculations

We write the Taylor series

$$
\begin{gather*}
f(x+h)=f(x)+\frac{h}{1!} f^{\prime}(x)+\frac{h^{2}}{2!} f^{\prime \prime}(x)+\frac{h^{3}}{3!} f^{\prime \prime \prime}(x)+\cdots \ldots(1  \tag{15}\\
\frac{\partial}{\partial x} f(x+h)=f^{\prime}(x)+\frac{h}{1!} f^{\prime \prime}(x)+\frac{h^{2}}{2!} f^{\prime \prime \prime}(x)+\frac{h^{3}}{3!} f^{\prime \prime \prime \prime}(x)+\cdots \ldots  \tag{16}\\
\frac{\partial}{\partial h} f(x+h)=f^{\prime(x)}+\frac{h}{1!} f^{\prime \prime}(x)+\frac{h^{2}}{2!} f^{\prime \prime \prime}(x)+\frac{h^{3}}{3!} f^{\prime \prime \prime \prime}(x)+\cdots \tag{17}
\end{gather*}
$$

From (10) and (11) we have,

$$
\begin{equation*}
\frac{\partial}{\partial x} f(x+h)=\frac{\partial}{\partial h} f(x+h)(1 \tag{18}
\end{equation*}
$$

Differentiating (10) with respect to $x+h$ [holding x as constant]

$$
\begin{align*}
\frac{\partial}{\partial x} f(x+h)= & \frac{d}{d(x+h)} f(x+h)  \tag{19}\\
{\left[\frac{\partial}{\partial x} f(y)\right]_{y=x} } & =\left[\frac{\partial}{\partial h} f(y)\right]_{y=y} \tag{20}
\end{align*}
$$

$\frac{\partial}{\partial x} f(y)=\frac{d f(x)}{d x}$ is a constant on $(x, x+h)$. This notion may be considered to show that $\frac{d f(x)}{d x}$ is constant everywhere.[we take $(x, x+h),(x+h, x+2 h),(x+2 h, x+3 h)$....and consider the proof given over and over again]

$$
\frac{\partial}{\partial x} f(x)=\text { const } \Rightarrow \frac{\partial^{2}}{\partial x^{2}} f(x)=0
$$

which we got earlier
Now [treating $f$ as a function of $x$ and $h$ we may write

$$
d f(x+h)=\frac{\partial}{\partial x} f(x+h) d x+\frac{\partial}{\partial h} f(x+h) d h(21)
$$

Again

$$
\begin{gather*}
d f(x+h)=\frac{\partial}{\partial(x+h)} f(x+h) d(x+h)  \tag{22}\\
\Rightarrow d f(x+h)=\frac{\partial}{\partial(x+h)} f(x+h) d x+\frac{\partial}{\partial(x+h)} f(x+h) d h \tag{23}
\end{gather*}
$$

From (21) and (22) we have,

$$
\begin{gather*}
{\left[\frac{\partial}{\partial(x+h)} f(x+h)-\frac{\partial}{\partial x} f(x+h)\right] d x+\left[\frac{\partial}{\partial(x+h)} f(x+h)-\frac{\partial}{\partial h} f(x+h)\right] d h=0} \\
\frac{\partial}{\partial(x+h)} f(x+h)=\frac{\partial}{\partial x} f(x+h)=\frac{\partial}{\partial h} f(x+h) \tag{24}
\end{gather*}
$$

We clearly see that the function $\frac{d f}{d x}$ is a constant function that is $\frac{d^{2} f}{d x^{2}}=0$

## Further Considerations

We recall (9)

$$
\begin{equation*}
f\left(x_{0}+h\right)=f\left(x_{0}\right)+\frac{h}{1!} f^{\prime}\left(x_{0}\right)+\frac{h^{2}}{2!} f^{\prime \prime}\left(x_{0}\right)+\frac{h^{3}}{3!} f^{\prime \prime \prime}\left(x_{0}\right)+\cdots \ldots \tag{9}
\end{equation*}
$$

We differentiate the above with respect to $x=x_{0}+h^{\prime} ; h^{\prime}<h$

$$
\begin{gather*}
{\left[\frac{d f\left(x_{0}+h\right)}{d h}\right]_{h=h^{\prime}}=f^{\prime}\left(x_{0}\right)+h^{\prime} f^{\prime \prime}\left(x_{0}\right)+\frac{h^{\prime 2}}{2!} f^{\prime \prime \prime}\left(x_{0}\right)+\cdots . .=f^{\prime}\left(x_{0}+h^{\prime}\right)}  \tag{25}\\
\frac{d f\left(x_{0}+h\right)}{d\left(x_{0}+h\right)}=\frac{d f\left(x_{0}+h\right)}{d h} \frac{d h}{d\left(x_{0}+h\right)}=\frac{d f\left(x_{0}+h\right)}{d h} \\
\frac{d f\left(x_{0}+h\right)}{d\left(x_{0}+h\right)}=\frac{d f\left(x_{0}+h\right)}{d h}(26)
\end{gather*}
$$

We obtain an indication of constancy of $\frac{d f\left(x_{0}+h\right)}{d h}$ from (26) and keeping in mind equation (18) we have

$$
\frac{\partial}{\partial x} f(x+h)=\frac{\partial}{\partial h} f(x+h)=\frac{d f(x+h)}{d(x+h)}
$$

Next we consider a truncated Taylor series which has been approximated with ' $n$ ' terms. Now we have an equation and not an identity and there are discrete solutions for $h$. Since we have taken an approximation to the Taylor series it is least likely the corresponding roots will cause a divergence of the infinite series in the Taylor expansion. It would be better to take a truncation which is not an approximation but the infinite Taylor series is convergent for it. These solutions for ' $h$ ' will not satisfy the entire Taylor series with an infinite number of terms. Suppose one solution of ' $h$ ' from approximated equation[equation with finite number of terms] satisfied the infinite Taylor series, we will have (9) as well as a truncated (9)[approximated up to ' $n$ ' terms. The situation has been delineated below

We noOwcconsider the Maclaurin expansion for $e^{x}$

$$
\begin{array}{r}
e^{x}=1+\frac{x}{1!}+\frac{x^{2}}{2!}+\frac{x^{2}}{2!}+\cdots+\frac{x^{n}}{n!}+\cdots \cdot \\
e^{x}=1+\frac{x}{1!}+\frac{x^{2}}{2!}+\frac{x^{2}}{2!}+\cdots+\frac{x^{n}}{n!}+\epsilon_{n}(x) \tag{26}
\end{array}
$$

$\epsilon_{n}(x):$ Remainder after the $n$th term count starting from zero: $\mathrm{n}=0,1,2 \ldots \ldots$.

$$
\epsilon_{0}(x)=e^{x}-1
$$

Differentiating (26) with respect to ' $x$ ' for a fixed ' $n$ 'we obtain

$$
\begin{gather*}
\frac{d e^{x}}{d x}=1+\frac{x}{1!}+\frac{x^{2}}{2!}+\frac{x^{2}}{2!}+\cdots+\frac{x^{n-1}}{(n-1)!}+\frac{d \epsilon_{n}(x)}{d x}  \tag{27}\\
e^{x}=1+\frac{x}{1!}+\frac{x^{2}}{2!}+\frac{x^{2}}{2!}+\cdots+\frac{x^{n-1}}{(n-1)!}+\frac{d \epsilon_{n}(x)}{d x}  \tag{28}\\
\frac{d \epsilon_{n}(x)}{d x}-\epsilon_{n}(x)=\frac{x^{n}}{n!}(29) \\
\frac{d^{2} e^{x}}{d x^{2}}=\frac{x}{1!}+\frac{x^{2}}{2!}+\frac{x^{2}}{2!}+\cdots+\frac{x^{n-2}}{(n-1)!}+\frac{d^{2} \epsilon_{n}(x)}{d x^{2}}
\end{gather*}
$$

We consider a positive interval $\left(x_{1}, x_{2}\right)$ and make $n \rightarrow \infty$.For such an interval

$$
\begin{gathered}
\lim _{n \rightarrow \infty} \frac{x^{n}}{n!}=0 \\
\lim _{n \rightarrow \infty}\left[\frac{d \epsilon_{n}(x)}{d x}-\epsilon_{n}(x)\right]=\lim _{n \rightarrow \infty} \frac{x^{n}}{n!} \\
\lim _{n \rightarrow \infty}\left[\frac{d \epsilon_{n}(x)}{d x}-\epsilon_{n}(x)\right]=0
\end{gathered}
$$

For sufficiently large, $\mathrm{n}\left|\frac{d \epsilon_{n}(x)}{d x}-\epsilon_{n}(x)\right|$ can be made arbitrarily close to zero
For the concerned interval we have in the limit n tending to infinity [for the interval $\left(x_{1}, x_{2}\right)$ ]the following[rigorous]equation

$$
\begin{gathered}
\frac{d \epsilon_{\infty}(x)}{d x}-\epsilon_{\infty}(x)=0 \\
\ln \epsilon_{\infty}(x)=x+C^{\prime}
\end{gathered}
$$

If $C^{\prime}=0$

$$
\begin{equation*}
\epsilon_{\infty}(x)=e^{x} \tag{31.1}
\end{equation*}
$$

If $C^{\prime} \neq 0, C^{\prime}=\ln C$

$$
\begin{equation*}
\epsilon_{\infty}(x)=C e^{x} \tag{31.2}
\end{equation*}
$$

Again

$$
C=0 \Rightarrow C^{\prime}=-\infty
$$

That means we used $-\infty$ as the constant of integration in equation (30.2).Suppose we take $\left|C^{\prime}\right| \gg$ $0 ; C^{\prime}<0$ so that $C$ is a very small fraction:

$$
C e^{x_{1}}<\epsilon_{\infty}(x)<C e^{x_{2}}
$$

But the point is that once we decide on the value of C[C cannot be minus infinityby itself if a value is considered] we cannot vary it. Though $\epsilon_{\infty}(x)$ will be very small we cannot take it arbitrarily close to zero

Next we consider a much larger the interval $\left(x_{1}, x_{2}{ }^{\prime}\right)$ which contains the interval $\left(x_{1}, x_{2}\right) ; x_{2}{ }^{\prime} \gg x_{2}\left[x_{2}{ }^{\prime}\right.$ remaining finite. We have the same equation as given by (30.1) and the same solution $\epsilon_{\infty}(x)=$ $C e^{x}$. This time we cannot change the value of the constant. If we changed it to $C_{n e w}$ then we have untenable results li8ke $\epsilon_{\infty}\left(x_{1}\right)=C_{n e w} e^{x_{1}}$ and $\epsilon_{\infty}\left(x_{2}\right)=C_{n e w} e^{x_{2}}$. But with the old constant $\epsilon_{\infty}\left(x_{2}{ }^{\prime}\right)=$ $C e^{x_{2}{ }^{\prime}} \gg 0$ since $x_{2}^{\prime} \gg x_{2}$

It is not possible to cover the entire $x$ axisor the semi $x$ axis: $(0, \infty)$ by a single constant having a numerical value.

The discrepancy we have found should not surprise us in view of the earlier discrepancies, for example those notified through case1 and case2.

## Further Investigation

$$
e^{x}=1+\frac{x}{1!}+\frac{x^{2}}{2!}+\frac{x^{2}}{2!}+\cdots+\frac{x^{n}}{n!}+\epsilon_{n}(x)
$$

We define $f(x, n)$ as follows:

$$
\begin{gather*}
f(x, n)=1+\frac{x}{1!}+\frac{x^{2}}{2!}+\frac{x^{2}}{2!}+\cdots+\frac{x^{n}}{n!}  \tag{33}\\
f(x, n)-f(x, n-1)=\frac{x^{n}}{n!}
\end{gather*}
$$

We make $\mathrm{r} f(x, n)$ a smooth[obviously continuous) by interpolation with a suitable curve where n isposotive everywhere.

$$
\begin{gather*}
\frac{\partial f(x, n)}{\partial n}-\frac{\partial f(x, n-1)}{\partial n}=\frac{x^{n} \ln x}{n!}+x^{n} \frac{d}{d n}\left(\frac{1}{n!}\right) \\
\frac{\partial f(x, n)}{\partial n}-\frac{\partial f(x, n-1)}{\partial n}=\frac{x^{n} \ln x}{n!}-x^{n} \frac{1}{n!}\left[\frac{1}{n}+\frac{1}{n-1}+\frac{1}{n-2}+\cdots 1\right] \tag{35}
\end{gather*}
$$

In the above $n!=n(n-1) \ldots$ up to $|n|$ terms. The equation considers right handed derivatives exclusively.

For large ' $n$ ' the left side of $(35)$ is zero: $f(x, n) \approx f(x, n-1) \approx e^{x}$

Therefore,

$$
\lim _{n \rightarrow \infty}\left[\frac{x^{n} \ln x}{n!}-x^{n} \frac{1}{n!}\left[\frac{1}{n}+\frac{1}{n-1}+\frac{1}{n-2}+\cdots 1\right]\right]=0
$$

That is to say that in the limit irrespective of the value of $x---x$ very large or very small

$$
\begin{aligned}
& \frac{\ln x}{n!} \approx \frac{1}{n!}\left[\frac{1}{n}+\frac{1}{n-1}+\frac{1}{n-2}+\cdots 1\right] \\
& \ln x \approx\left[\frac{1}{n}+\frac{1}{n-1}+\frac{1}{n-2}+\cdots 1\right]
\end{aligned}
$$

We have a strange result

$$
x \approx e^{\left[\frac{1}{n}+\frac{1}{n-1}+\frac{1}{n-2}+\cdots 1\right]} ; n: \text { very large but constant in value }
$$

NB: For testing, in the above, w have taken a very large but fixed value of $x$ so as to ensure that on the left side of (35) we have an approximately.

## Looking Directly into Sources of Error

Assume that the formula for $e^{x}$ holds simultaneously over the entire real axis $x \in(-\infty, \infty)$. We4 partition he real axis into accountably infinite number of closed intervals indexed by the natural numbers. The remainder term[Cauchy form], $R_{n}=\frac{x^{n}}{n!} e^{\theta x}$ should tend to zero for all intervals we have in the partition. For any preassigned $\epsilon>0$ no matter how small we have for

Interval 1: $N_{1}>0$ such that for all $n>N_{1}$ we have $\left|R_{n}\right|<\epsilon$
Interval 2: $N_{2}>0$ such that for all $n>N_{2}$ we have $\left|R_{n}\right|<\epsilon$
Interval 3: $N_{3}>0$ such that for all $n>N_{3}$ we have $\left|R_{n}\right|<\epsilon$
Interval k: $N_{k}>0$ such that for all $n>N_{k}$ we have $\left|R_{n}\right|<\epsilon$
$\qquad$
$\qquad$

Fort the largest $N_{k},\left|R_{n}\right|<\epsilon$ for all intervals. There is no such largest $N_{k}$ [we cannot denote it numerically]

Therefore our usual formula for $e^{x}$ will not hold for the entire real axis at one stroke..

Analogous conclusions may follow from all non terminating instances of the Taylor series.

## Conclusions

As claimed we have arrived at some inconsistent aspects of the Taylor expansion References
